

# Single Line Reefing

Single line reefing is now available as a retrofit option on existing Kemp slab reefing booms. Developed as part of a co-ordinated programme of mainsail handling improvements, the upgrade provides two single line reefs and a third reef with separate tack and clewlines. Intended for operation from the cockpit, the system enables the crew to reef rapidly and safely.

Suitable for booms from 111/75 up to 162/125 section size, the routing of lines ensures minimum friction and least complexity. On the smaller sizes, the third reef clewline also operates the outhaul car. The maximum height of reef 2 is 80% of sail foot length (E), reef 3 is unlimited. Conversion to single line reefing can be done by any Kemp Service Agent.

Single line reefing is suitable for conventional and fully battened mainsails. The addition of

lazy jacks or a stack type stowage system further improves ease of handling.
